Subject: Detrex Chloroform, 1,4-Dioxane, Methylene Chloride, or Trichloroethylene Statement

To whom it may concern,

Chlorinated solvents, such as chloroform, methylene chloride, and trichloroethylene are a class of organic solvents containing at least one covalently bonded atom of chlorine. 1,4-Dioxane is classified as an ether and used to stabilize trichloroethylene.

These products are routinely used in medical and cosmetic products, and when used responsibly are not generally regarded as significant health hazards. However, they can pose a hazard to the environment when not disposed of properly.

Detrex Chemicals does not use any products such as chloroform, dioxane, methylene chloride, or trichloroethylene in the manufacture, storage, or packaging of their hydrochloric acid products.

While we do not routinely test for these compounds, to the best of our knowledge we have no reason to suspect they may exist in our hydrochloric acid products.

Sincerely,

A handwritten signature in black ink that reads "Dave Morgan". The signature is fluid and cursive, with the first name "Dave" being more prominent than the last name "Morgan".
